What is the Queensland Cancer Quality Index (The Cancer Index)?

The Cancer Index report has been developed for public and private cancer services. It is an initiative of the Cancer Alliance Queensland which brings together the Cancer Control Safety and Quality Partnership (The Partnership), Queensland Cancer Control Analysis Team (QCCAT) and the Queensland Cancer Register (QCR)(https://cancerallianceqld.health.qld.gov.au). The report tracks Queensland's progress towards delivering safe, quality cancer care and will be provided to all relevant public and private hospitals. The Cancer Index highlights areas for improvement and identifies the areas where cancer services are performing well.

The Cancer Index has five dimensions and multiple indicators developed by Cancer Alliance Queensland in partnership with the clinical subcommittees. (Walpole, Theile, Philpot et al. 2019).¹⁸

| Quality Dimension | Description |
|-------------------|--|
| 1 Effective | Achieving the best outcomes for Queenslanders with cancer |
| 2 Efficient | Optimally using resources to achieve desired outcomes |
| 3 Safe | Avoiding and preventing adverse outcomes or injuries caused by healthcare management |
| 4 Accessible | Making health services available in the most suitable setting in a reasonable time |
| 5 Equitable | Providing care and ensuring health status does not vary in quality because of personal characteristics |

This version of The Cancer Index has been expanded to include breast, colorectal, CNS and brain, gynaecological, hepatobiliary, lung, prostate, upper GI and urological cancers. The Cancer Index now includes indicators about surgery and radiation therapy, intravenous systemic therapy with other dimensions of care. Additional dimensions and indicators will be added in response to clinician, hospital, HHS, Queensland Health and community feedback.

The Cancer Index reports on available data released for publication annually, however there may have been changes more recently that are not captured by the time periods reported. Regardless, The Cancer Index provides an important tool for monitoring current investments in cancer care and changes in clinical practice. It also enables us to reflect on past improvement programs and identify areas where a renewed effort or new approach may be required.

Why develop the Cancer Index?

Performance indicators linked to clinical outcomes that align with national benchmarking is a key service action in the Cancer Care State-wide Health Service Strategy, 2014¹⁷. The Cancer Index has been developed by the Cancer Alliance Queensland, lead clinicians and relevant persons under the auspices of the Queensland Cancer Control Safety and Quality Partnership (The Partnership). The Cancer Alliance Queensland supports a clinician-led, safety and quality program for cancer across Queensland. The Partnership was gazetted as a quality assurance committee under Part 6, Division 1 of the Hospital and Health Boards Act 2011 in 2004. A key role of The Partnership is to provide cancer clinicians, Hospital and Health Services (HHS), public and private hospitals, public and private treatment facilities and Queensland Health with cancer information and tools to deliver the best patient care.

Where has the data come from?

Since 2004 the Queensland Cancer Control Analysis Team (QCCAT), a sub-committee of the Partnership have compiled and analysed a vast amount of information about cancer incidence, mortality, treatment, and survival. Key to QCCAT's program of work is the ability to match and link population-based cancer information on an individual patient basis. This matched and linked data is housed in the Queensland Oncology Repository (QOR), a resource managed by QCCAT. This centralised repository compiles and collates data from a range of source systems including the Queensland Cancer Register, private and public hospital admissions data, death data, treatment systems, public and private pathology, hospital clinical data systems and QOOL. QOR contains millions records from 1982 onwards. Our matching and linking processes provide matched and linked records of cancer patients from 1982 onwards which provide the data for The Queensland Cancer Quality Index.

For further information on data sources and methods refer to The Cancer Index Technical Appendix.

How to interpret this report

The Cancer Index should be interpreted in the context of the previous publications by The Partnership. To access previous publication, go to https://cancerallianceqld.health.qld.gov.au/publications. These publications provide information on cancer incidence, mortality and survival, surgery, radiation therapy, and intravenous systemic therapy rates and patient flows which is important information for understanding the indicators reported in The Cancer Index.

Many of the indicators have been statistically adjusted for age and sex. This is done to account for any changes in who is being diagnosed with cancer. For example, the introduction or expansion of a screening program may increase the number of cancers being diagnosed in some age groups within the population.

Rather than focus on differences in rates, it would be of more benefit to focus on changes over time and variations in outcomes between different sectors of the population and determine whether these are in line with clinician, patient or community expectations.

Descriptions of all terms and definitions can be found in the glossary section.

Looking to the future

The Cancer Index provides baseline measurements for the on-going monitoring of the quality of cancer care in Queensland. The Partnership will continue to seek feedback from cancer services, Queensland Health and the community on The Cancer Index. They will lead the development and reporting of quality indicators for other aspects of cancer management and outcomes which will be included in future versions.

What does the Cancer Index tell us about cancer in Queensland?

The Cancer Index is a first for Queensland. This fifth edition reports on data spanning 15 years of cancer care and highlights where the health system has performed well and where improvements are possible.

Cancer survival compares favourably with the rest of Australia. 1 Effective Most patients receive treatment for their cancer. For most cancers there is little difference in the length of hospital stay between public and private patients receiving cancer surgery. 2 Efficient Across several cancers the median length of hospital stay has been reducing over time. For the majority of cancers, surgical mortality rates in Queensland are lower than 3 Safe or comparable to national or international published data. Public patients waited longer for their first cancer treatment than private patients. 4 Accessible Across most cancers, the proportion of rural, remote and regional patients receiving treatment within 30 days of diagnosis was significantly lower compared to metropolitan patients. Age is not a barrier to receiving first cancer treatment within 30 days. There is little difference in rates of receiving treatment within 30 days of diagnosis 5 Equitable between First Nations patients treated in any hospital and non First Nations patients treated in a public hospital. There is a wide gap in waiting for treatment between patients of socioeconomic disadvantage compared to other groups.

| | Bladder | (3%) | (11%) | (20%) |
| Urological | | 43 | 132 | 329 |
| | Testicular | (6%) | (17%) | (36%) |

Rates have been adjusted for age and sex. MDT rates includes facilities that use QOOL, or Townsville ROIS, or lung cancer conference at PA Hospital. QOOL supports cancer multidisciplinary teams by assisting with meeting preparation, communication, and documentation of essential clinical information such as diagnosis, cancer stage and recommended treatment plans. QOOL provides continuity of care and state-wide multidisciplinary team linkage and provides access to clinical outcomes and system performance data for quality improvement. The web based system provides a central view of patient data for multiple users, accessible at multiple locations.

1.3 | Queenslanders receiving cancer surgery

How many Queenslanders with cancer receive surgery?

| Surgery number (Number of cance) | r patients receiving surgery) | | | Queensland | |
|----------------------------------|---|-------------------------|--|--|--|
| Cancer group | Cancer | Surgery type | 2006-2010 Surgery number (rate) | 2011-2015 Surgery number (rate) | 2016-2020 Surgery number (rate) |
| Breast | Breast | Breast cancer surgery | 12,186 (91%) | 14,412 (91%) | 16,146 (90%) |
| | Colon | Major resection | 7,557 (80%) | 7,864 (78%) | 8,198 (76%) |
| Colorectal | Rectal | Major resection | 3,141 (71%) | 3,188 (67%) | 2,856 (59%) |
| CNS and brain | Brain | Major resection | 1,214 (83%) | 1,300 (83%) | 1,487 (83%) |

3 Safe

Avoiding and preventing adverse outcomes or injuries caused by healthcare management.

3.1 | In-Hospital mortality

What percentage of patients die in hospital after cancer surgery?

| In-Hospital mort | aiit y die in hospital followii | na cancer suraery) | | Queensland | |
|------------------|---|-------------------------|---|---|---|
| Cancer group | Cancer | Surgery type | 2006-2010 In-Hospital mortality rate | 2011-2015 In-Hospital mortality rate | 2016-2020 In-Hospital mortality rate |
| Breast | Breast | Breast cancer surgery | <1% | 0% | 0% |
| | Colon | Major resection | 3% | 1.7% | 1.4% |
| Colorectal | Rectal | Major resection | 2% | 1% | 0.9% |
| CNS and brain | Brain | Major resection | 2.7% | 1.5% | 0.8% |
| | Cervical | Major resection | 0% | 0% | 0% |
| | Ovarian | Major resection | 0.4% | 0% | 0.3% |
| Gynaecological | Uterine | Major resection | 0.1% | 0.2% | 0.2% |
| | Vulva | Major resection | 0.7% | 0% | 0% |
| | Head and neck | Major resection | 0.3% | 0.3% | 0.3% |
| | Hypopharynx | Major resection | 2.5% | 1% | 1.3% |
| | Larynx | Major resection | 0.3% | 0% | 0.7% |
| | Major salivary glands | Major resection | 0% | 0% | 0% |
| Head and neck | Nasal cavity and paranasal sinuses | Major resection | 0% | 0% | 0% |
| | Nasopharynx | Major resection | 0% | 0% | 0% |
| | Oral cavity | Major resection | 0.3% | 0.5% | 0.4% |
| | Oropharynx | Major resection | 0.3% | 0% | 0% |
| | Other pharynx | Major resection | 0% | 0% | 0% |
| | Liver | Major resection | 4.8% | 2.3% | 0.2% |
| Hepatobiliary | Pancreatic, biliary tract & duodenal | Pancreaticoduodenectomy | 1.3% | 3.4% | 1% |
| Lung | Non-small cell | Major resection | 1.4% | 0.6% | 0.2% |
| Prostate | Prostate | Prostatectomy | 0.1% | 0.1% | <1% |
| | Gastric | Gastrectomy | 2.6% | 2.2% | 1.3% |
| Upper GI | Oesophagus | Oesophagectomy | 0.4% | 1.3% | 1.1% |
| | Bladder | Cystectomy | 1.2% | 0.6% | 0.5% |
| Urological | Testicular | Orchidectomy | 0.3% | 0% | 0% |

Rates have been adjusted for age and sex. Crude rates have been used for cancers with less than 20 cases.

Cancers with less than 20 cases should be interpreted with caution due to the poor reliability of rate calculations based on small numbers. (Refer to Table 1.3 for number of surgery cases).

3.2 | 30 day mortality

What percentage of patients die within 30 days of their cancer surgery?

| 30 day mortality (% natients who d | ie ≤ 30 days following cancei | r surgenu) | | Queensland | | Other sources |
|-------------------------------------|---|-------------------------|--|--|--|-----------------------------|
| Cancer group | Cancer | Surgery type | 2006-2010 30 day mortality rate | 2011-2015 30 day mortality rate | 2016-2020 30 day mortality rate | 30 day mortality rate |

ASR: age standardised rate per 100,000 population.

 $^{^{}st}$ Biliary tract (not incl Bile Ducts and Vater C240-C241).

[§] Head and neck (not incl External lip C000-C002).

Glossary

1 year survival

All-cause crude survival: the percentage of patients still alive after 1 year from their last cancer surgery.

2 year survival

All-cause crude survival: the percentage of patients still alive after 2 years from their last cancer surgery.

30 day mortality

The percentage of patients that die within 30 days following their last cancer surgery.

90 day mortality

The percentage of patients that die within 90 days following their last cancer surgery.

Age and sex adjusted figures

Rates have been adjusted by age and sex to account for any differences in cancer populations across the two periods of interest.

Affluent

The group of patients whose socioeconomic status is affluent (refer to **Socioeconomic status** in Glossary).

Age-standardised incidence/mortality (ASR)

The number of new cases or deaths per 100,000 that would have occurred in a given population if the age distribution of that population was the same as that of the Australian population in 2001 and if the age-specific rates observed in the population of interest had prevailed. In international comparisons, the World Standard Population was used as the reference population.

Age-standardised rates are independent of the age-structure of the population of interest and are therefore useful in making comparisons between different populations and time periods.

Annual average

The sum of the numbers divided by how many numbers are being averaged. For example, 2010-2014 incidence annual average is the sum of incidence from 2010 to 2014 divided by 5.

Disadvantaged

The group of patients whose socioeconomic status is disadvantaged (refer to **Socioeconomic status** in Glossary).

Five-year survival

All-cause crude survival: the percentage of cases still alive five year after diagnosis.

Five-year relative survival

Relative survival is a net survival measure representing cancer survival in the absence of other causes of death. Relative survival is defined as the ratio of the proportion of observed survivors in a cohort of cancer patients to the proportion of expected survivors in a comparable set of cancer free individuals.

Relative survival is calculated by dividing observed survival by expected survival, where the numerator and denominator have been matched for age, sex and calendar year.

Observed survival refers to the proportion of people alive for a given amount of time after a diagnosis of cancer; it is calculated from population-based cancer data. Expected survival refers to the proportion of people in the general population alive for a given amount of time and is calculated from life tables of the entire Australian population, assumed to be cancer free.

Changes to cancer incidence rates and the underlying life tables to may lead to fluctuations in relative survival estimates. Accordingly, caution should be used when making comparisons to historically reported rates of relative survival.

First cancer treatment

The first treatment the patient had for their cancer – either surgery, radiation therapy or intravenous systemic therapy.

First Nations peoples

The terminology First Nations peoples refers to the Aboriginal peoples and Torres Strait Islander peoples, their nations, societies, and language groups that have occupied these lands since time immemorial.

Hospital Stay

The median time in days between the admission and discharge date of a patient's cancer surgery.

Incidence (new cases)

The number of new cases of cancer diagnosed in a defined population during a specified time period. For example, 2014 incidence is the number of cancers which were first diagnosed between 1 January 2014 and 31 December 2014.

In-Hospital mortality

The percentage of patients that die in hospital following their last cancer surgery.

Intravenous systemic therapy

Includes Queensland residents of all ages diagnosed with invasive cancer who had intravenous systemic therapy after diagnosis.

Length of stay

The average in number of days patients stay in hospital for their cancer surgery.

Middle

The group of patients whose socioeconomic status is middle (refer to Socioeconomic status in Glossary).

MDT Review

Cancer patients are discussed by a Multidisciplinary Team to make sure that all available treatment options are considered.

MDT number

Number of cancer patients who had MDT review any time after diagnosis.

Mortality (deaths)

The number of deaths attributed to cancer in a defined population during a specified time period regardless of when the diagnosis of cancer was made.

Non First Nations peoples

A measure where a person does not identify as Aboriginal peoples and/or Torres Strait Islander peoples (First Nations peoples).

Over 75 years

Population divided into over 75 years and under 75 years, it describes Queensland's ageing population.

P value/ P value trend

The p-value is a number, calculated from a statistical test such as Pearson's chi square test. A p-value of <0.05 indicates the results are significant and there is less than a 5% probability the findings are due to chance alone.

To examine differences in proportions across subgroups such as public and private, Indigenous status and age group, Pearson's chi square (P value) was used.

The Cochrane-Armitage test (P value trend) for trend was used for analysis by remoteness and socioeconomic status which provides a non-parametric test of the trend of the proportions of positive responses in the groups (such as patients who received treatment within 30 days of diagnosis).

Prevalence

The number of Queenslanders with a diagnosis of cancer who were alive on 31 December 2020.

Private hospital

All other hospitals that are not Queensland Health hospitals.

Public hospital

Queensland Health hospitals.

QOOL

QOOL supports cancer multidisciplinary teams by assisting meeting preparation, communication and documentation of essential clinical information such as diagnosis, cancer stage and recommended treatment plans. QOOL provides continuity of care and state-wide multidisciplinary team linkage and provides access to clinical outcomes and system performance data for quality improvement. The system provides a central view of patient data for multiple users, accessible at multiple locations.

Radiation therapy

Includes Queensland residents of all ages diagnosed with invasive cancer who had radiation therapy after diagnosis. For further information on radiation therapy https://www.targetingcancer.com.au

Remoteness

The relative remoteness of residence at time of diagnosis, derived from the Australian Standard Geographical Classification (ASGC). In this report, remoteness is classified into three groups based on the original ASGC grouping.

| ASGC classifications | Modified ASGC classification |
|----------------------|------------------------------|
| Major City | Metropolitan |
| Inner Regional | Regional |
| Outer Regional | |
| Remote | Rural and Remote |
| Very Remote | |

An exception to this grouping is the metropolitan area of Townsville (originally classified as Rural). Townsville has been classified as Metropolitan because of the availability of tertiary level cancer services.

Sex

Refers to the biological and physiological characteristics that define men and women.

Socioeconomic status

Socioeconomic status is based on the Socio-Economic Indexes for Areas (SEIFA), a census-based measure of social and economic well-being developed by the Australian Bureau of Statistics (ABS) and aggregated at the level of Statistical Area Level 2 (SA2).

The ABS use SEIFA scores to rank regions into ten groups or deciles numbered one to ten, with one being the most disadvantaged and ten being the most affluent group. This ranking is useful at the national level, but the number of people in each decile often becomes too small for meaningful comparisons when applied to a subset of the population. For this reason, this document further aggregates SEIFA deciles into 3 socioeconomic groups.

| SEIFA Group | Decile | Percentage of population(approximate) |
|---------------|--------|---------------------------------------|
| Disadvantaged | 1-2 | 20% |
| Middle | 3-8 | 60% |
| Affluent | 9-10 | 20% |

Statistical analysis

To examine differences in proportions across subgroups such as public and private, First Nations peoples and age group, Pearson's chi square was used. For analysis by remoteness and socioeconomic status a non-parametric test such as the Cochrane-Armitage test for trend was used which provides a test of the trend of the proportions of positive responses in the groups (such as patients who received treatment within 30 days of diagnosis). All statistical analyses were conducted using Stata V5.1 (Stata Corp, College Station, TX, USA).

Statistical Area Level 4 (SA4)

Statistical Areas Level 4 (SA4) are geographical areas built from whole Statistical Areas Level 3 (SA3s). https://www.abs.gov.au/websitedbs/d3310114.nsf/home/australian+statistical+geography+standard+(asgs).

Surgery/Major Resection

Refer to The Cancer Index Technical Appendix.

Surgery number

Includes Queensland residents of all ages diagnosed with invasive cancer in the surgical cohort time period who underwent cancer surgery.

Survival

Relative survival is a net survival measure representing cancer survival in the absence of other causes of death. Relative survival is defined as the ratio of the proportion of observed survivors in a cohort of cancer patients to the proportion of expected survivors in a comparable set of cancer free individuals.

Time to first cancer treatment

Time between the patient's pathological diagnosis and their first cancer treatment.

Timeliness

A patient's time to cancer treatment from pathological diagnosis.
